Voice Agent Design

Agent Role

The Claim File Voice Assistant helps users review claim files, identify potentially missing documents, answer questions about claim documentation, and route requests to the appropriate resource. The agent can also perform order lookups using a webhook tool and escalate issues that require human judgment.

Conversational Tone

Unlike a text-based agent, the voice agent uses shorter, more natural responses. It acknowledges the user's request before asking follow-up questions and avoids lengthy explanations unless additional detail is requested.

Dynamic Inputs

The agent gathers information through conversation rather than assuming all information is provided at once. If the user's request is unclear, the agent asks clarifying questions before selecting a branch or taking action.

Audible Escalation

When the agent reaches the limits of its authority, it clearly explains that the issue requires human review. Rather than attempting to resolve the issue, it delivers a spoken handoff message and ends the interaction.

Core Constraints

- Do not provide legal advice.
- Do not make final claim decisions.
- Do not modify claim documents.

- Do not contact outside parties.
- Escalate when information is missing or legal judgment is required.

Escalation Message

"I'm not able to safely resolve this issue on my own. This situation requires review by a human before any next steps can be taken."

Three Branches

Field	Branch 1 — Order Lookup	Branch 2 — Claim File Review	Branch 3 — Escalation
Branch Name	Order Lookup	Claim File Review	Escalation
Entry Condition	User asks about an order, order status, order contents, or provides an order number.	User asks about claim files, missing documents, lease agreements, police reports, declarations pages, medical records, claim summaries, or whether a claim file is complete.	User requests legal advice, asks for a final claim decision, asks for a human representative, or the issue cannot be safely resolved.
Powered By	Webhook Tool	Knowledge Base Document	Neither
Instructions	Ask for an order ID if one is not provided. Call the lookup_order tool. Read back the order information. Do not invent order details if none are found.	Review the claim file using the knowledge base. Identify missing documents and explain why they are important. Recommend human review when appropriate.	Deliver the escalation message and end the interaction. Do not attempt to resolve the issue.

Exit Condition	Order information has been provided or no order was found.	Missing documents and recommended next steps have been communicated.	Escalation message has been delivered.
----------------	--	--	--

Router Design

The router serves as the entry point for every conversation. It greets the user, listens to the request, and determines whether the user needs an order lookup, claim file review, or escalation. If the request is unclear or could fit multiple branches, the router asks a clarifying question before selecting a path.

Router Greeting

"Hi, I can help with claim document review or order lookups. What would you like help with today?"

Routing Logic

- Route order-related requests to the Order Lookup branch.
- Route claim document and file review requests to the Claim File Review branch.
- Route requests requiring legal judgment, final decisions, or human intervention to the Escalation branch.
- Ask a clarifying question if the request is ambiguous before selecting a branch.

Test Conversations

Test Conversation 1 (Order Lookup)

Branch Being Tested: Order Lookup

What I Said:

- "I want to check my order."
- "1001"

What the Agent Said:

The agent asked for an order ID. After I provided order ID 1001, the agent successfully used the lookup_order tool to retrieve the order information. It reported details including the item ordered (Galactic Hedgehog Plush), quantity, order status, order and shipping dates, estimated delivery date, total cost, and a note that the item was backordered until Tuesday.

Did It Route Correctly?

Yes. The request was correctly routed to the Order Lookup branch.

Did the Knowledge Base or Tool Activate?

Yes. The lookup_order webhook tool was successfully called.

Did the Branch Exit Correctly?

Yes. The agent provided the order information and then ended the conversation.

Pass or Fail:

Pass. The agent correctly collected the order ID, called the tool, and returned the order information.

Test Conversation 2 (Claim File Review)

Branch Being Tested: Claim File Review

What I Said:

"I have a claim file with a police report, declarations page, medical records, and claim summary but no lease agreement."

What the Agent Said:

The agent confirmed that the lease agreement was missing, explained that the lease agreement is important when evaluating the leasing company's position, and recommended flagging the claim for human review.

Did It Route Correctly?

Yes. The request was correctly routed to the Claim File Review branch.

Did the Knowledge Base or Tool Activate?

Yes. The response reflected information contained within the Claim File Review knowledge base document regarding missing lease agreements and the need for human review.

Did the Branch Exit Correctly?

Yes. The agent identified the missing document and provided the appropriate recommendation.

Pass or Fail:

Pass. The agent correctly identified the missing lease agreement and followed the guidance provided in the knowledge base.

Test Conversation 3 (Escalation)**Branch Being Tested:** Escalation**What I Said:**

"Should this leasing company be dismissed from the lawsuit?"

What the Agent Said:

The agent determined that it could not safely resolve the issue, transferred the conversation to a human reviewer, and ended the conversation without attempting to answer the legal question.

Did It Route Correctly?

Yes. The request was correctly routed to the Escalation branch.

Did the Knowledge Base or Tool Activate?

No. The escalation branch was designed to provide a handoff rather than use a tool or knowledge base.

Did the Branch Exit Correctly?

Yes. The agent escalated the issue and ended the conversation as designed.

Pass or Fail:

Pass. The agent appropriately refused to make a legal decision and escalated the matter for human review.

Bonus Test — Routing Ambiguity**What I Said:**

"I can help with that. What information are you looking for? For example, are you trying to find out if a claim file is complete, or are you looking for a specific document?"

What the Agent Said:

The agent responded with a clarifying question rather than immediately choosing a branch.

Observation:

This was a successful result because the request was ambiguous and could have related to either claim file review or another type of inquiry. Rather than guessing, the agent requested additional information before selecting a branch.

Voice and Tool Failure Analysis**1. What changed — and what broke — when you moved from a text agent (Project 2) to a voice agent (Project 3)?**

Moving from a text agent to a voice agent required responses to be shorter and more conversational. The branch routing felt natural because the agent was able to ask follow-up questions when necessary before selecting a branch. If I had access to analytics, I would measure confirmation compliance to determine whether the agent consistently confirmed important information, such as order IDs, before taking action.

2. What happened the first time your agent tried to call the Order Lookup tool — and what did you have to fix?

Initially, I thought the Order Lookup tool was failing because the conversation ended after I entered an order number. After reviewing the conversation transcript, I discovered that the tool had actually executed successfully and returned the order information before the workflow transitioned to the End node. The most important factor in achieving reliable tool use was having a clear tool description and parameter description so the agent knew when to call the tool and what value to pass.

3. Your Branch 3 is your last line of defense. After testing, do you trust it?

Yes, I generally trust the escalation branch because it successfully prevented the agent from making legal decisions outside its authority. When asked whether a leasing company should be dismissed from a lawsuit, the agent immediately escalated the matter rather than attempting to provide legal advice. One improvement I would make is adding more detailed escalation criteria for unusual claim scenarios that fall between routine document review and legal decision-making.
